AGAP

Alert. Guide. Assist. Protect

OVERVIEW

AGAP is a mobile emergency response app designed for *residents* and *Miagao MDRRMO (Municipal Disaster Risk Reduction and Management Office) personnel*. It streamlines how communities prepare for, report, and respond to emergencies—both natural disasters and man-made accidents. Built in consultation with *MDRRMO Miag-ao.* AGAP bridges a critical gap between residents in need and the responders who serve them—making emergency coordination *faster*, *smarter*, and *calmer.*

Who It's For	What they Get
Residents	SOS Alerts, medical info storage, family management
Responders	Receive SOS alerts, manage patient records, track incidents

PROBLEM STATEMENT

When emergencies strike, ***every second counts***; but current systems are often *slow*, *fragmented*, and *paper-based*.

• **No centralized medical information**: responders arrive without knowing the patient's allergies, conditions, or medications
• **Manual, slow processes**: incident reports and forms are filled out by hand, asking questions that can be answered even before an accident, causing delays and errors
• **Poor coordination:** residents have no reliable way to alert MDRRMO, and responders lack structured data
• **No feedback loop:** people who ask for help don't know if anyone is coming
• **Privacy gaps:** access to sensitive resident data is often unmonitored and unregulated

There is a visible gap within the current emergency response system. It leads to panic, wasted time, and preventable harm. AGAP aims to address it directly.

SOLUTION

AGAP transforms an existing *unsystematic process* into a *structured*, *digital emergency response platform*. Residents stay prepared before an emergency happens. Responders get the tools they need to act fast when it does.

• Preparedness - residents fill out and maintain medical info in advance
• Speed - SOS alerts instantly deliver location and medical data to responders
• Coordination - one unified platform connects residents and MDRRMO
• Accountability - data access is logged, encrypted, and privacy-respecting

AGAP is not just for during a disaster, it prepares you before one even happens.

KEY FEATURES

Residents' Interface

Onboarding

- **Sign-up page** where users log and create their acounts

Medical Information

- A dedicated **Medical Info Page** where residents store personal health data (conditions, medications, allergies, blood type, etc.)
- **Smart reminders:**
    - Notified within **1 week** of account creation if medical info hasn't been filled out yet
    - **Periodic update prompts** (e.g., every 3 months) to keep records accurate and current

SOS / Emergency Alert

- One-tap **SOS button** that sends the resident's **medical information + real-time location** to MDRRMO
- Works both online and offline via **mesh networking** — critical in disaster scenarios where connectivity is disrupted
- **Feedback mechanism** — after sending SOS, the resident receives a confirmation (e.g., *"Help is on the way"*) so they know their alert was received

Family & Emergency Contacts

- **Add and manage family members** within the app
- **Update family member information** as needed
- **Set a primary emergency contact** for priority notification

MDRRMO / Responder Interface

Responder Profile & Access

- Dedicated **responder sign-up and profile page**
- Ability to **toggle between resident and responder interface** for personnel who are also community members

SOS Management

- **Receive SOS alerts** complete with resident's personal and medical information
- **Search for a resident's information** — all searches are **logged and monitored** for accountability (especially for cases where the patient did not send the SOS themselves)

Patient Health Care (PHC) Form

- Responders can **create, edit, and update** Patient Health Care forms during or after an incident
- PHC forms can be created for **non-app users** as well (e.g., bystanders, unconscious individuals)
- **Auto-filled** with relevant data from: SOS alert, patient profile, and responder info

Reports Tracker

- A **table-based incident tracker** for MDRRMO to monitor all reported emergencies
- Most fields are **automatically populated** from SOS data, patient info, and responder details
- Provides a clear, structured log of incidents for review and reporting purposes

---

Data Privacy & Security

Security Feature	Description
Account IDS	Every user (resident or responder) has a unique account identifier
Access Logging	All access to resident data is logged with personnel/account ID
Data Encryption	All sensitive data is encrypted at rest and in transit

How It Works

1. SIGN UP

L Resident creates an account → completes the onboarding guide

2. PREPARE

Resident fills out Medical Info Page

L App reminds them within 1 week if not yet filled

L Periodic reminders to keep info updated

3. EMERGENCY OCCURS

Resident taps the SOS button

L App sends: location + medical info to MDRRMO

L Works via mesh if no internet connection

L Resident receives: "Help is on the way" confirmation

4. RESPONDER ACTS

MDRRMO receives SOS alert with full resident profile

L Responder dispatches and prepares based on medical data

L On-site: PHC form is created/updated (auto-filled)

5. DOCUMENTATION & ENDORSEMENT

Incident is logged in the Reports Tracker

Impact

- **Faster emergency response** — responders arrive informed and prepared
- **Reduced panic and confusion** — residents know help is coming; responders know what to expect
- **Stronger community-MDRRMO coordination** — a shared, structured system replaces fragmented communication
- **Streamlined patient endorsement** — structured PHC forms make handoffs to healthcare facilities smoother
- **Covers all emergency types** — not limited to natural disasters; includes man-made accidents and incidents
- **Improved MDRRMO workflow** — less time on paperwork means more time responding

---

This project embodies the theme by emphasizing **preparedness over reaction**:

- Residents are **proactively maintaining** their medical records before emergencies happen
- MDRRMO gains tools to **respond faster and more effectively**
- The system **strengthens existing protocols and policies** rather than replacing them
- It reduces the chaos, time loss, and inefficiency that occur when communities are caught off guard

AGAP is about building **a culture of readiness** — so that when disaster strikes, the community is already one step ahead.

Real-World Validation

This system was developed with **real stakeholders in mind**:

- **Consulted with MDRRMO Miag-ao** to understand actual workflows, pain points, and needs
- MDRRMO already uses **radio devices and has existing contacts with barangay officials** — this platform **complements and enhances** those systems rather than replacing them
- Residents are already **knowledgeable about nearby evacuation centers** — the app works within that existing awareness
- MDRRMO has existing protocols and technology for tracking weather, heat index, and seismic data — this platform fills the gap in **human emergency response coordination**

The result is a solution grounded in reality, not assumption.

How to Download

Android (APK)

1. Download the APK file here: **[Download Link — Coming Soon]**
2. On your Android device, go to **Settings** → **Security** and enable **"Install from Unknown Sources"**
3. Open the downloaded APK file and tap **Install**
4. Launch **AGAP** and create your account

Team

Name	Role
Leona Blancaflor	Backend Developer - SOS System
Sam Lansoy	Backend Developer - Responder Interface
Myra Verde	Backend Developer - Resident Interface
Eleah Melchor	Frontend Developer - Responder Interface
Chrystie Sajorne	Frontend Developer - Resident Interface
Nikko Gabriel Hismaña	Adviser

Built with love for communities that deserve better emergency systems.
